Heterogeneous Modeling Languages
Complex Software Intensive Systems

- Multiple concerns
- Multiple viewpoints & stakeholders
- Multiple domains of expertise
- => Need languages to express them!
  - In a meaningful way for experts
  - With tool support (analysis, code gen., V&V..)
    - Which is still costly to build
  - At some point, all these concerns must be integrated
Limits of General Purpose Languages (1)

• **Abstractions and notations** used are not natural/suitable for the stakeholders

```java
if (newGame) resources.free();
s = FILENAME + 3;
setLocation(); load(s);
loadDialog.process();

try {
    setGamerColor(RED);
}
catch(Exception e) {
    reset();
}
while (notReady) {
    objects.make();
    if (resourceNotFound) break;

    byte result; // СМЕНЬТНа int!
music();
System.out.print("");
```
Limits of General Purpose Languages (2)

- Not targeted to a **particular** kind of problem, but to any kinds of software problem.
Domain Specific Languages

• Targeted to a **particular** kind of problem
  - with dedicated notations (textual or graphical), support (editor, checkers, etc.)

• Promises: more « efficient » languages for resolving a set of specific problems in a domain
Abstraction Gap

Problem Space

Assembler

C, Java

DSLs

Solution Space
« Another lesson we should have learned from the recent past is that the development of 'richer' or 'more powerful' programming languages was a mistake in the sense that these baroque monstrosities, these conglomerations of idiosyncrasies, are really unmanageable, both mechanically and mentally.

I see a great future for very systematic and very modest programming languages »

1972

ACM Turing Lecture, « The Humble Programmer »
Edsger W. Dijkstra

aka Domain-Specific Languages
Domain Specific Languages (DSLs)

- Long history: used for almost as long as computing has been done.
- You’re using DSLs in a daily basis
  - Even if you do not recognize them as DSLs (yet), because they have many different forms
- More and more people are building DSLs
<?xml version="1.0" encoding="iso-8859-1"?>
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN" "DTD/xhtml1-transitional.dtd">
<html xml:lang="en" lang="en" xmlns="http://www.w3.org/1999/xhtml">
  <head>
    <title>Hello World</title>
  </head>
  <body>
    <p>My first Web page.</p>
  </body>
</html>

Domain: web (markup)
.CodeMirror {
    line-height: 1;
    position: relative;
    overflow: hidden;
}

.CodeMirror-scroll {
    /* 30px is the magic margin used to hide the element's real scrollbars */
    margin-bottom: -30px; margin-right: -30px;
    padding-bottom: 30px; padding-right: 30px;
    height: 100%;
    outline: none; /* Prevent dragging from highlighting the element */
    position: relative;
}

.CodeMirror-sizer {
    position: relative;
}
SQL

```sql
SELECT Book.title AS Title,
       COUNT(*) AS Authors
FROM Book
JOIN Book_author
ON Book.isbn = Book_author.isbn
GROUP BY Book.title;

INSERT INTO example
  (field1, field2, field3)
VALUES
  ('test', 'N', NULL);
```

Domain: database (query)
Makefile

```makefile
PACKAGE = package
VERSION = `date "%Y.%m%d"`
RELEASE_DIR = ..
RELEASE_FILE = $(PACKAGE)-$(VERSION)

# Notice that the variable LOGNAME comes from the environment in # POSIX shells.
# 
# target: all - Default target. Does nothing.
all:
  echo "Hello $(LOGNAME), nothing to do by default"
  # sometimes: echo "Hello ${LOGNAME}, nothing to do by default"
  echo "Try 'make help'"

# target: help - Display callable targets.
help:
  egrep "^# target:" [Mm]akefile

# target: list - List source files
list:
  # Won't work. Each command is in separate shell
cd src
ls

  # Correct, continuation of the same shell
cd src; \
ls
```

Issues of DSL Engineering

- Versions
- Variants
- Separation of concerns / Composition
Versions of a DSL: a Typical Lifecycle

- Starts as a simple ‘configuration’ mechanism
  - for a complex framework, e.g.; video processing

- Grows more and more complex over time
  - ffmpeg -i input.avi -b:v 64k -bufsize 64k output.avi
    - Cf [https://www.ffmpeg.org/ffmpeg.html](https://www.ffmpeg.org/ffmpeg.html)

- Evolves into a more complex language
  - ffmpeg config file
    - A preset file contains a sequence of option=value pairs, one for each line, specifying a sequence of options. Lines starting with the hash (#) character are ignored and are used to provide comments.

- Add macros, if, loops,…
  - might end up into a Turing-complete language!
Variants of a DSL

- **Abstract syntax variability**
  - functional variability
    - E.g. Support for super states in StateCharts
      - 50+ variants of StateCharts Syntax have been reported!

- **Concrete syntax variability**
  - representation variability
    - E.g. Textual/Graphical/Color…

- **Semantics variability**
  - interpretation variability
    - E.g. Inner vs outer transition priority
Variants Also at Semantic Level

Event “e” leads to

S4 (UML), S5 (Rhapsody), or (S6) Stateflow

"UML vs. Classical vs. Rhapsody Statecharts: Not All Models are Created Equal", Michelle Crane, Juergen Dingel
Different shapes for a DSL: External

- External DSLs with their own syntax and domain-specific tooling
  - Nice for the non-programmers
  - Good for separation of concerns
  - Bad for integration

- Example: SQL

```sql
-- Select all books by authors born after 1920, 
-- named "Paulo" from a catalogue: 
SELECT *
FROM t_author a
JOIN t_book b ON a.id = b.author_id
WHERE a.year_of_birth > 1920 
   AND a.first_name = 'Paulo'
ORDER BY b.title
```
Different shapes for a DSL: Internal/Embedded

- Internal/Embedded DSLs, blending their syntax and semantics into host language (C++, Scala, C#)
  - Splendid for the gurus
  - Hard for the rest of us
  - Excellent integration

- Example: SQL in LINQ/C#

```csharp
// DataContext takes a connection string
DataContext db = new DataContext("c:\northwind\northwnd.mdf");
// Get a typed table to run queries
Table<Customer> Customers = db.GetTable<Customer>();
// Query for customers from London
var q =
    from c in Customers
    where c.City == "London"
    select c;
foreceach (var cust in q)
    Console.WriteLine("id = {0}, City = {1}", cust.CustomerID, cust.City);
```
Different shapes for a DSL: Implicit

- Implicit = from plain-old API to more fluent APIs
  - Good for Joe the Programmer
  - Bad for separation of concerns, V&V
  - Good for integration

- Example: SQL

```java
Connection con = null;

String query = "insert into user values(" + student.getId() + "
+ student.getFirstName() + "," + student.getLastName()
+ "," + student.getEmail() + "," + student.getPhone()
+ ");"

try {
  // get connection to db
  con = new CreateConnection().getConnection("che" + "root");

  // get a statement to execute query
  stmt = con.createStatement();

  // executed insert query
  stmt.execute(query);
  System.out.println("Data inserted in table ");
}
```

Result<Record> result = create.select()
\[
  .from(T_AUTHOR.as("a"))
  .join(T_BOOK.as("b")) on(a.ID.equal(b.AUTHOR_ID))
  .where(a.YEAR_OF_BIRTH.greaterThan(1920))
  .and(a.FIRST_NAME.equal("Paulo"))
  .orderBy(b.TITLE)
  .fetch();
\]
SoC: Modeling and Weaving

Challenges:
- Product Families
- Reuse of Weaving Process
- Automatic Weaving
Gemoc Initiative

Focuses on SLE tools and methods for interoperable, collaborative, and composable modeling languages

"On the Globalization of Modeling Languages" [GEMOC]
From supporting a single DSL…
- Concrete syntax, abstract syntax, semantics, pragmatics
  - Editors, Parsers, Simulators, Compilers…
  - But also: Checkers, Refactoring tools, Converters…

To supporting Multiple DSLs
- Interacting altogether
- Each DSL with several flavors (variants)
- And evolving over time (versions)

Product Lines of DSLs!
- Safe reuse of the tool chains?
- Backward compatibility, Migration of artifacts?
My Goal

• **Ease the definition of tool-supported DSL families**
  - How to ease and validate the definition of new DSLs/tools?
  - How to correctly reuse existing tools?

⇒ **Bring external DSL design abilities to the masses**
  ⇒ Use abstractions that are familiar to the OO Programmer to define languages
  ⇒ set of DSL to build DSLs
  ⇒ Leverage static typing to foster safe reuse
  ⇒ With a appropriate definition of type

Kermeta: Executable Meta-Modeling for the masses

// MyKermetaProgram.kmt
// An E-MOF metamodel is an OO program that does nothing
require "StateMachine.ecore" // to import it in Kermeta

// Kermeta lets you weave in aspects
// Contracts (OCL WFR)
require “StaticSemantics.ocl”
// Method bodies (Dynamic semantics)
require “DynamicSemantics.xtend”
// Transformations

class FSM {
  public def void reset() {
    currentState = initialState
  }
}

class Minimizer {
  public def FSM minimize (source: FSM) {…}
}
A tool (aka Model Transformation) is just a program working with specific OO data structures (aka meta-models) representing abstract syntax trees (graphes).

- Kermeta approach: organize the program along the OO structure of the meta-model
- Any software engineer can now build a DSL toolset!
  - No longer just for genius…

Product Lines of DSLs = SPL of OO programs

- Safe reuse of the tool chains -> Static typing
- Backward compatibility, Migration of artifacts -> Adaption
Type Systems

- Type systems provide unified frameworks enabling many facilities:
  - Abstraction
  - Reuse and safety
  - Impact analyses
  - Auto-completion
  - ...

- What about a model-oriented type system?
Model Type – motivation

• Motivating example: model transformation [SoSyM'07] takes as input a state machine and produces a lookup table showing the correspondence between the current state, an arriving event, and the resultant state

⇒ side-effect free

⇒ When can we reuse such a transformation?
Model Type – motivation

• Issue when considering a model as a set of objects:
  ▪ addition of a property to a class is a common evolution seen in metamodels
  ▪ property = pair of accessor/mutator methods

⇒ subtyping for classes requires invariance of property types!!!
⇒ Indeed: adding a property will cause a covariant property type redefinition somewhere in the metamodel.
Class Matching [Bruce et al., ENTCS 1999]

- Substitutability of type groups cannot be achieved through object subtyping

Animal a = Animal.new
Food f = Food.new
a.eat(f)

Animal a = Cow.new
Food f = Grass.new
a.eat(f)

Animal a = Cow.new
Food f = Hamburger.new
a.eat(f)

Animal a = Animal.new
Food f = Food.new
a.eat(f)
Model Type – motivation

- Some (other) differences for objects in MOF:
  - Multiplicities on properties
  - Properties can be combined to form associations: makes checking cyclical
  - Need to check whether properties are reflexive or not
  - Containment (or not) on properties
Model Type – initial implementation

• Bruce has defined the matching relation \((<#)\) between two type groups as a function of the object types which they contain.

• Generalizing his definition to the matching relation between model type:

  Model Type \(M' <# M\) iff for each object type \(C\) in \(M\) there is a corresponding object type with the same name in \(M'\) such that every property and operation in \(M.C\) also occurs in \(M'.C\) with exactly the same signature as in \(M.C\).

  \[\text{matching} \equiv \text{subtyping} \ (\text{by group})\]
Application to MOF-Class Matching

• C1 matches C2 (C1 <# C2) iff:
  - Same names
  - If C1 is abstract, it can only match another abstract class
  - ∀ C2 operation, C1 must have a corresponding operation
    - With the same name
    - With covariant return type
    - With corresponding parameters
      - In the same order
      - With contravariant types
      - With the same multiplicities
      - With the same isUnique attribute
  - ∀ C2 property, C1 must have a corresponding property
    - With the same name
    - With covariant type
    - With the same multiplicities
    - With the same isUnique and isComposite attributes
    - With an opposite with the same name
  - Every mandatory property in C1 must correspond to a C2 property
Model Type – initial implementation

<table>
<thead>

Basic FSM Model Type  Final States FSM Model Type

A Basic FSM Operation Applied on a Final States FSM
Model Type – initial implementation

• Supports:
  ▪ the addition of new classes (FinalState)
  ▪ the tightening of multiplicity constraints (Mandatory)
  ▪ the addition of new attributes (indirectly with Composite State Charts, via the added inheritance relationship)

  ⇒ Match-bounded polymorphism

• Does not support:
  ▪ multiple initial states: accessing the `initialState` property in Basic state machine will return a single element typed by `State` while in Multiple state machine it will return a `Collection<State>`

  ⇒ technical nightmare!
comment inférer si l'addition n'a pas d'impact ?
Par exemple si l'ajout est obligatoire dans un objet instancié par la transformation.
==> exception !
Benoit Combemale; 21/09/2011

ne peut-il pas être détecté et générer automatiquement les adapteur ?
Benoit Combemale; 19/09/2011
Model Type – enhancing matching relation

• Issues:

  ▪ metamodel elements (e.g., classes, methods, properties) may have different names.
  ▪ types of elements may be different.
  ▪ additional or missing elements in a metamodel compared to another.
  ▪ opposites may be missing in relationships.
  ▪ the way metamodel classes are linked together may be different from one metamodel to another
Model Type – enhancing matching relation

• Motivating example: model refactoring [MODELS'09]

**Pull Up Method**: moving methods to the superclass when methods with identical signatures and results are located in sibling subclasses.

⇒ Model refining (with side-effect)

⇒ How to reuse such transformation?
Model Type – enhancing matching relation

Model Type $M'$ matches another model type $M$ (denoted $M' <\# M$) iff for each class $C$ in $M$, there is one and only one corresponding class or subclass $C'$ in $M'$ such that every property $p$ and operation $op$ in $M.C$ matches in $M'.C'$ respectively with a property $p'$ and an operation $op'$ with parameters of the same type as in $M.C$.

• In practice to specify generic model refactorings:

  1. specify a lightweight metamodel (or model type) that contains the minimum required elements for refactorings.
  2. specify refactorings based on the lightweight metamodel.
  3. adapt the target metamodels using Kermeta for weaving aspects adding derived properties and opposites that match with those of the generic metamodel.
  4. apply the refactoring on the target metamodels
Model Type – enhancing matching relation

1. Generic Model Type for the Pull Up Method Refactoring

   ![Diagram of model type enhancing matching relation]

2. Kermeta Code for the Pull Up Method Refactoring

```kotlin
package refactor;

aspect class Refactor <MT : GenericMT> {

  operation pullUpMethod(  
    source : MT::Class, 
    target : MT::Class, 
    meth : MT::Method ) : Void

  // Preconditions
  pre sameSignatureInOtherSubclasses is do
    target.subClasses forall { sub | 
      sub.methods.exists { op | haveSameSignature(meth, op) } }
  end

  // Operation body
  is do
    target.methods.add(meth)
    source.methods.remove(meth)
  end
}
```
Model Type – enhancing matching relation

3 Kermit Code for Adapting the Java Metamodel

```java
package java;

require "Java.ecore"

aspect class Classifier {
    reference inv_extends : Classifier[0..*]#extends
    reference extends : Classifier[0..1]#inv_extends
}

aspect class Class {

    property superClasses : Class[0..1]#subClasses
    getter is do
        result := self.extends
    end

    property subClasses : Class[0..*]#superClasses
    getter is do
        result := OrderedSet<java::Class>.new
        self.inv_extends.each{ subC | result.add(subC) }
    end
}
```
Model Type – enhancing matching relation

4 Kermetra Code for Applying the Pull Up Method

```plaintext
package refactor;

require "http://www.eclipse.org/uml2/2.1.2/UML"

class Main {
    operation main() : Void is do

        var rep : EMFRepository init EMFRepository.new

        var model : uml::Model
        model ?= rep.getResource("lan_application.uml").one

        var source : uml::Class init getClass("PrintServer")
        var target : uml::Class init getClass("Node")
        var meth : uml::Operation init getOperation("bill")

        var refactor : refactor::Refactor<uml::UmlMM>
            init refactor::Refactor<uml::UmlMM>.new

        refactor.pullUpMethod(source, target, meth)

    end
}
```
Bottom Line: Model Subtyping Relations

• Are models typed by MT1 substitutable to models typed by MT2?

• Two criterions to be considered
  ▪ Structural heterogeneities between the model types
  ▪ Context in which the subtyping relation is used
Structural heterogeneities

- **Isomorphic**
  - MT1 possesses the same structure as MT2
  - Comparison using class matching

- **Non-isomorphic**
  - Same information can be represented under different forms
  - Model adaptation from MT1 to MT2
Context of use

• **Total**
  - We can safely use a model typed by MT1 *everywhere* a model typed by MT2 is expected

• **Partial**
  - We can safely use a model typed by MT1 *in a given context where* a model typed by MT2 is expected
    - I.e., reuse of a given model manipulation $m$
  - MT1 must possess all the information needed for $m$
    - I.e., the *effective model type* of $m$ from MT2
4 Model Subtyping Relations

- Total isomorphic Matching
- Partial isomorphic + Pruning
- Total non-isomorphic + Adaptation
- Partial non-isomorphic + Pruning + Adaptation
Conclusion on Model Sub-Typing

• Current state in model typing
  ▪ reuse of model transformations between isomorphic graphs
  ▪ deal with structure deviation by weaving derived properties
  ⇒ Stractically checked in Kermeta!!
Model Type – *Further Needs in a Model Type System*

• **Issues:**
  
  ▪ New DSLs are not created from scratch
    ⇒ DSLs family (e.g., graph structure)
  
  ▪ Model transformations cannot yet be specialized
    ⇒ call to *super* and polymorphism
  
  ▪ Reuse through model type matching is limited by structural conformance
    ⇒ use of (metamodel) mapping
  
  ▪ Chains of model transformations are fixed & hardcoded
    ⇒ partial order inference of model transformations
a voir pourquoi ?

Benoît Combemale; 19/09/2011
Wrap-up: Challenges

확보

- language constructs, grammars, editors or tool chains (model transformations, compilers…)

확보

- replacement of one software artifact (e.g. code, object, module) with another one under certain conditions

확보

- introduction of new constructs, abstractions, or tools
Challenges for DSL Modularity

- Modularity and composability
  - structure software applications as sets of interconnected building blocks

- How to breakdown a language?
  - how the language units should be defined so they can be reused in other contexts
    - What is the correct level of granularity?
    - What are the services a language unit should offer to be reusable?
    - What is the meaning of a service in the context of software languages?
    - What is the meaning of a services composition in the context of software languages?
Challenges for DSL Modularity

How can language units be specified?

• not only about implementing a subset of the language
• but also about specifying its boundary
  – the set of services it offers to other language units
  and the set of services it requires from other
  language units.
• classical idea of required and provided interfaces
  – introduced by components-based software
  engineering approaches.
  – But... What is the meaning of “provided and required
  services" in the context of software languages?
• composability & substitutability
  – Extends vs. uses
Big Picture: Variability Everywhere

- **Variability in Metamodelling:**
  - Semantic variation point
  - DSML Families
  - Knowledge capitalization
  - Language Engineering

- **Variability in Modeling:**
  - Support positive and negative variability
  - Derivation semantics must take into account the assets language semantics
Challenges: Verification & Validation

Questions:

- is a language really suited for the problems it tries to tackle?
- Can all programs relevant for a specific domain be expressed in a precise and concise manner?
- Are all valid programs correctly handled by the interpreter?
- Does the compiler always generate valid code?

=> Design-by-Contract, Testing
Conclusion

From supporting a single DSL…

- Concrete syntax, abstract syntax, semantics, pragmatics
  - Editors, Parsers, Simulators, Compilers…
  - But also: Checkers, Refactoring tools, Converters…

…To supporting Multiple DSLs

- Interacting altogether
- Each DSL with several flavors: families of DSLs
- And evolving over time

Product Lines of DSLs

- Share and reuse assets: metamodels and transformations
